Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC This sequence represents a Leu/Lys diastereomer peptide of the CC invention. The peptides of the invention have: (a) cytolytic activity on the peptides of the invention have: (a) cytolytic activity on the cells (pathogenic cells (pathogenic and malignant cells not naturally present in CC concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as CC cancer, in human deveterinary medicine. Also, they can be used as CC agricultural posticides. The absence of haemolytic activity (associated convented in the control of alpha-helical structures) means that the peptides concreased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since cresistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
      New non-haemolytic cytolytic agent useful in treating cancer or infections - is a peptide comprising a moiety which disrupts the continuity of an alpha-helical structure
                                                                     WPI; 1998-594464/50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copplymer. The agent has a selective cytolytic activity on CC pathogenic cells. The agent is selected from a cyclic derivative of a CC peptide which has a net positive charge greater than 1, comprises L-amino CC congrises in a peptide (or cyclic derivative of this) which CC (comprises I-amino acid residues and comprises an alpha-helix CC (comprises I-amino acid residues and comprises an alpha-helix CC (comprises I-amino acid residues and Damino acid residues, has a net CC including amino acid sequence comprising only I-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, CC including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be cosmetic and food industries, as pesticides (e.g. fungicides or cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.

DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA694 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes composition of matter (I) comprising FC domain, pharmacologically active peptides, and linkers. Where (I) (X1)a-F1-(X2)b, where: FI = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of

CC This peptide is used in a novel process for the synthesis of a KL-4 CC pulmonary surfactant protein. The process comprises: (a) reacting a CC 3-amino acid peptide residue of formula H-Lys(Z)-Leu-Leu-OH with a 5-CC amino acid peptide residue Boc-Leu-Lys(Z)-Leu-Leu-OH (II) to yield CC an 8-amino acid peptide to form an 18-amino acid peptide of formula CC H-Leu-Leu(Lys(Z)-Leu-Leu(Lys(Z)-Leu-Leu)-OH (III) to yield CC peptide with a 3-residue amino acid peptide of formula H-Leu-Leu-CC Lys(Z)-OBzl (X) to form the protected 21-amino acid KL-4 protein; and CC (c) removing the protecting group of the 21-amino acid KL-4 protein by reaction with a suitable acid to form the final KL-4 protein. The CC the synthetic pulmonary surfactant KL-4 which can be used in the CC the synthetic pulmonary surfactant KL-4 which can be used in the CC treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl CC control of the protect form the final KL-4 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of KL-4 pulmonary surfactant - using liquid phase peptide synthesis procedures by coupling appropriate peptide fragments

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This peptide is used in a novel process for the synthesis of a KL-4 CC 3-amino acid peptide residue of formula H-Lys(Z)-Leu-Leu-OH with a 5-CC amino acid peptide residue Boc-Leu-Lys(Z)-Leu-Leu-OH with a 5-CC an 8-amino acid peptide residue, which is successively reacted with the CC H-Leu-Leu(Lys(Z)-Leu-Lys(Z)-DEDI (III)) to yield CC F-amino acid peptide to form an 18-amino acid peptide of formula CC H-Leu-Leu(Lys(Z)-Leu-Lys(Z)-DEDI (III)) to yield CC H-Leu-Leu(Lys(Z)-Leu-Lys(Z)-DEDI (III)) reacting the 18 amino acid peptide of formula CC peptide with a 3-residue amino acid peptide of formula H-Leu-Leu-CC (c) removing the protecting group of the 21-amino acid KL-4 protein; and CC reaction with a suitable acid to form the final KL-4 protein. The CC methods can be used for the preparation of the polypeptide component of CC treatment of respiratory distress syndrome. The saponification process group with reduced racemisation of a peptide ester protected carboxyl provide advantages in solubility and control over unwanted by-products.

                                                                                                                                                                                                                                                                                                                                      Qy
                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a Leu/Lys diastereomer peptide of the CC invention. The peptides of the invention have: (a) cytolytic activity on the body; but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse cc pathogens. The peptides, their complexes and mixtures are used to treat cor cancer, in human and veterinary medicine. Also, they can be used as cc preservatives for food, cosmetics and agricultural produce, or as cc with disturbance of alpha-halical structures) means that the peptides cc with disturbance to protecly a structures) means that the peptides cc increased resistance to proteclytic degradation. Non-haemolytic, cor cytotxic random copolymers of pardaxin, each has a specific spectrum of these random copolymers induce total lysis of bacterial cell walls, xx resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                              This peptide is used in a novel process for the synthesis of a KL-4 CC pulmonary surfactant protein. The process comprises: (a) reacting a CC 3-amino acid peptide residue of formula H-Lys(Z)-Leu-Leu-OH with a 5-CC anino acid peptide residue Boc-Leu-Lys(Z)-Leu-Leu-OH (II) to yield CC anino acid peptide to form an 18-amino acid peptide of formula CC H-Leu-Lys(Z)-Leu4)3Lys(Z)-OBZ1 (IIIa); (b) reacting the l8 amino acid peptide of formula CC Lys(Z)-OBZ1 (IIIa); (b) reacting the 18 amino acid c(c) reaction with a 3-residue amino acid peptide of formula H-Leu-Leu-CC (c) removing the protecting group of the 21-amino acid KL-4 protein; and CC methods can be used for the protecting from the final KL-4 protein. The CC treatment of respiratory distress syndrome. The saponification process group with reduced racemisation. The liquid phase peptide processes cropping the protection of a peptide ester protected carboxyl provide advantages in solubility and control over unwanted by products.
                                                                                                                                                                                                                                                                                                                  δÃ

The methods can be used drugs, toxins and peptides which act on lipid bilayer membranes. The parts in order to affect the structure or integrity or permeability of a body of the animal or plant or within the cells of the body of the animal or plant or within the cells of the body of the animal or plant or within the cells of the body of the animal or plant or within the cells of the body of the animal

The process comprises: (a) reacting a 3-amino acid peptide residue of formula H-Lys(2)-Leu-Leu-OH with a 5-amino acid peptide residue Boc-Leu-Leu-Lys(2)-Leu-Leu-OH (II) to yield an 8-amino acid peptide residue, which is successively reacted with the 5-amino acid peptide to form an 18-amino acid peptide of formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lys(Z)-OBzl (X) to form the protected 21-amino acid KL-4 protein; and (c) removing the protecting group of the 21-amino acid KL-4 protein by reaction with a suitable acid to form the final KL-4 protein. The methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl group with reduced racemisation. The liquid phase peptide processes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide is an example of a highly generic peptide comprising 10 60 amino acid residues, including a sequence having alternating hydrophobic and hydrophilic amino acid residue regions. When the polypeptide is mixed with a phospholipid a synthetic pulmonary surfactant is formed which has greater surfactant activity than the phospholipid alone. The surfactant is used for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptide(s) comprising alternating hydrophobic and hydrophilic residue regions - are useful as pulmonary surfactants for treating respiratory distress syndrome
                                                                                                                                                                                                                                                                                                                                                                                                             AAW32109 standard; peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cc surfactant composition comprises a polypeptide and a phospholipid. cC The present sequence represents the polypeptide for use in the CC Ilposomal pulmonary surfactant composition. The preparation comprises CC exhibits enhanced solubility in ethanol, which comprises: (a) preparing a form of the polypeptide (or a salt or ester), which CC a solution of the polypeptide, salt or ester in a fluorinated alcohol CC density at 450 mm of < 0.06; (c) filtering; and (d) removing the CC fluorinated alcohol to recover solid, soluble polypeptide. The CC fluorinated alcohol to recover solid, soluble polypeptide. The CC fluorinated alcohol to recover solid, soluble polypeptide. The CC formation of a monolayer at the alveolar air-water interface, and by during expiration. The liposomal pulmonary surfactant composition can be used to promote the CC during expiration. The liposomal pulmonary surfactant composition can be used in premature infants and occasionally full term meonates who CC sometimes suffer from respiratory distress syndrome due to the lack of xx sufficient endogenous liposomal pulmonary surfactant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8888888888888888888888888888888888888

A novel process for its synthesis comprises: (a) reacting a 3-amino acid peptide residue of formula H-Lys(2)-Leu-Leu-OH with a 5-amino acid peptide residue boc-Leu-Leu-Lys(2)-Leu-Leu-OH (II) to yield an 8-amino acid peptide residue, which is successively reacted with the 5-amino acid peptide to form an 18-amino acid peptide of formula 18-amino acid peptide of formula 18-amino acid peptide of formula peptide with a 3-residue amino acid peptide of formula the 18 amino acid peptide with a 3-residue amino acid peptide of formula the 18 amino acid

```
C KL4 is a synthetic peptide that can be used in a synthetic pulmonary surfactant of the invention. It is a minic of human construction protein Sp-18. Synthetic pulmonary surfactants comprise one or more phospholipids and a peptide having alternating the protein sp-18 controlled the having alternating groups of the synthetic pulmonary surfactant is used in a claimed method for the synthetic pulmonary surfactant is used in a claimed method for pulmonary lavage of a mammal. Lavage is used to treat respiratory contents, pulmonary inflammation or infection, acute hypoxacmia, persistent foetal circulation, congenital diaphramatic hernia, persistent foetal circulation. The lavage solution removes inflammatory mediators and preserves or restores pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DЬ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Surfactant peptide KL4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-MAR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lys(2)-OBzl (X) to form the protected 21-amino acid KL-4 protein; and (C) removing the protecting group of the 21-amino acid KL-4 protein by reaction with a suitable acid to form the final KL-4 protein. The methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl group with reduced racemisation. The liquid phase peptide processes provide advantages in solubility and control over unwanted by-products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW82278;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Néurochem. 48:16-21(1987).

-I. FUNCTION: Catalyzes the reversible synthesis of acetylcholine
-(ACh) from acetyl CoA and choline at cholinergic synapses.
-I. CATALYTIC ACTIVITY: Acetyl-CoA + Choline = CoA + O-acetylcholine.
-I. SIMILARITY: BELONGS TO THE CARNITINE/CHOLINE ACETYLTRANSFERASE
                                                                                                                                                                           INIT_MET

Natl. Acad. Sci. U.S.A. 98:2017-2022(2001).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (ACh) from acetyl CoA and choline at choline gic synapses.

- CATALYTIC ACTIVITY: Acetyl-CoA+ choline = CoA+ O-acetylcholine.

- ALTERNATIVE PRODUCTS: 3 isoforms; M/83 kDa (shown here), S/74 kDa and R/70 kDa; are produced by alternative splicing.

- DISEASE: Defects in CHAT are a cause of familial infantile myasthenic gravis type 2 (FIMG2) (also known as CMS-BA). FIMG2 negative tests for anti-AchR antibodies, and abrupt episodic crises with increased weakness, bulbar paralysis, and apnea similarity: BeLONGS TO THE CARNITINE/CHOLINE ACETYLTRANSPERASE TANATTY
